

ASUR

The honest, firewalled AI Content Creation OS — that learns from every video.

What ASUR is (in one breath)

ASUR turns a **one-line idea** (or a song, or your own raw clip) into a finished 9:16 short video — and it does the whole job the way a disciplined creative team would: it **understands** the idea, **creates** the visuals, **edits** them, **honestly judges** whether it is strong, lets **you** approve, **measures** real performance, and **learns** so the next video is better.

It runs **100% on your own computer** with **no logins and no keys**. Nothing is faked, nothing is hidden, and nothing important happens without your say-so.

THE ONE-LINE MOAT (why nobody can copy it)

Competitors optimize one stage and resell the same frontier models. ASUR's edge is the **closed loop**: an honest, **firewalled** viral judge plus a **learning memory** so every video is informed by the measured performance of the last. The **system** is the product — you can swap in any generation engine (free today, paid frontier models later) by changing a config, not rewriting the app.

The loop (this is the heart of ASUR)

SCRIPT understands → **GENERATION** creates → **EDITING** shapes → **VIRAL CHECK** challenges → **a human decides** → **ANALYTICS** measures → **SCRIPT learns** → (repeat, better every time).

This document is a complete guide to ASUR — what it is, what it does today, how it is built, how it is delivered, and how it is sold. Pages 1-5 explain the product; pages 6-10 are the commercial case for buyers.

EXECUTIVE SUMMARY (for buyers)

The product. ASUR is a local-first operating system for short-form video creation. It takes a single idea, song, or raw clip and carries it all the way to a finished 9:16 video — scripting, generation, editing, an honest quality evaluation, your approval, and performance learning — without any cloud account, API key, or per-seat SaaS subscription.

The problem it solves. Teams today stitch together four or five paid tools (a scripting AI, a generation tool, an editor, a 'virality' predictor) that each resell the same frontier models, upload your material to their servers, and give you a confident-but-unfounded score. You pay several subscriptions, you lose ownership of your footage, and you still cannot trust the numbers.

Why ASUR is different. ASUR is one system, not five tools. It runs entirely on the client's own machine (their footage never leaves it), it refuses to invent a fake 'viral %', and it keeps a **firewall** between the part that makes the video and the part that judges it — so the judge cannot be gamed. Every video also makes the next one smarter through a measured learning loop.

THE FIVE THINGS A BUYER IS ACTUALLY PAYING FOR

What they pay for	What it means commercially
1. Privacy by architecture	Footage, scripts, and brand never leave the client's computer. Nothing to breach, nothing to leak.
2. An honest evaluator	A 12-dimension quality read with evidence — never a single made-up 'virality' percentage.
3. The firewall moat	Maker and judge are kept apart in code and tested to prove it. The scoring cannot be rubber-stamped.
4. A learning system	Real performance folds back in, so output quality compounds over time instead of staying flat.
5. No vendor lock-in	Stdlib-only core, no required subscriptions. The paid-model 'quality dial' is optional and swappable.

THE 8 PROMISES ASUR NEVER BREAKS

These are the unbreakable rules. Every part of ASUR obeys them, and the code is tested to prove it.

Promise	What it means for you
1. Stays local, no login	Runs on your machine. No accounts, no API keys, no internet needed. Your identity is just your computer user + git name.
2. Never a fake viral %	It will never say '93% viral'. It gives honest, separate signals and labels what is a fact vs a guess.
3. The firewall	The part that MAKES the video and the part that JUDGES it never talk directly. The judge can't be bribed to rubber-stamp. This is the moat.
4. Fail closed	If anything is missing or unclear, ASUR stops and waits — it never pushes forward on a guess.
5. Humans own approvals	You approve the look and the publish. The machine never publishes or does anything irreversible on its own.
6. Every asset is traceable	Each image/voice/clip carries where it came from and its licence — so you always know it is safe to use.
7. No black box	Every decision has a plain-language reason you can read.
8. Nothing silently overwritten	Every version is kept. You can always go back. Nothing is lost.

The 5 parts (instruments) + the conductor

Part	Plain-language job
SCRIPT	The brain. Understands the idea, writes hooks + the script, remembers what worked.
GENERATION	The creator. Turns the script into visuals, voice, music (the pixels).
EDITING	The editing room — shared, human-controlled. Timeline, effects, captions, cuts.
VIRAL CHECK	The honest judge. Scores 12 things 0-100, never one fake number.
ORCHESTRATOR	The conductor. Moves the project stage to stage, stops at the gates.
THE FIREWALL	Sits between the creator and the judge so they never collude. Nobody else has this.

THE HONEST EVALUATOR: 12 SCORES, NEVER ONE FAKE NUMBER

This is ASUR's signature and its moat. Instead of a single invented 'virality' percentage, VIRAL CHECK reads a video on **12 separate dimensions**, each scored 0-100 with an evidence class that says how strong the signal is. It returns a list — never a single number — and a clear **PASS / CHANGES / REJECT** verdict with reasons you can read.

Dimension	The honest question it asks
Attention	Does it stop the scroll in the first moment?
Retention	Does it hold the viewer through the middle?
Satisfaction	Does the ending pay off the promise of the hook?
Value	Does the viewer get something worth their time?
Shareability	Is there a reason to send it to someone?
Saveability	Is it worth bookmarking for later?
Replayability	Does it reward a second watch?
Originality	Does it feel fresh, not a copy?
Authenticity	Does it feel human and real, not AI-slop?
Visual Quality	Is the craft (framing, captions, grade) clean?
Audience Fit	Is it right for the intended audience?
Platform Fit	Is it shaped correctly for the platform?

WHY THIS IS THE SELLING POINT

Every competitor that promises a 'virality score' is guessing a future nobody can measure. ASUR refuses to do that. A buyer is paying for an evaluator they can **trust in front of a client** — one that shows its working, flags its own uncertainty, and cannot be quietly tuned to always say yes because the firewall keeps the judge away from the maker.

HOW ASUR WAS BUILT: 9 PHASES (P00-P08) - ALL DONE

ASUR was built phase by phase, tests first. **All 9 phases are complete and the test suite is green: 221 tests passing, 1 skipped (227 collected).**

#	Phase	What it gives you
P00	Foundations	The rulebook + safety checks (8 promises wired in, local-only guard).
P01	SCRIPT brain	Idea -> hooks -> full script, remembers past hooks.
P02	Orchestrator	The 18-step pipeline runtime + the two human gates.
P03	Firewall	Maker and judge kept apart; safe hand-off with fingerprints.
P04	Generation + Hero Proof	Plans the visuals; makes a tiny 5s proof to approve first.
P05	Editing room	Timeline, 15 editing primitives, captions, audio mix, full manual control.
P06	Full build + QA	Builds all sections; 5-family quality check incl. 'looks human not AI'.
P07	Viral Check	12 honest scores, yes/no risk flags, a PASS / CHANGES / REJECT verdict.
P08	Learning + Publish	You approve publish; real numbers fold back so the next video is smarter.

The pipeline + the 2 human gates

A project walks forward one safe step at a time (18 states). It **stops and asks you twice**: **(Gate 1) the Hero Proof** — approve a tiny 5-second sample before any expensive work; and **(Gate 2) Publish** — approve the finished video before anything goes out. ASUR never skips a gate and never self-approves irreversible steps.

CHEAP WORK EARLY, EXPENSIVE WORK ONLY AFTER YOU APPROVE THE PROOF

WHAT YOU CAN MAKE TODAY (3 real tools, free + local)

1. Idea -> Reel

Give one line (e.g. *'why most people waste money on AI tools'*). ASUR writes the whole script and renders a real 9:16 video with a natural voice, moving backgrounds and captions.

```
PYTHONPATH="$(pwd)" python3 render_demo.py
```

2. Your clip -> 2+ polished edits

Give your own video. ASUR auto-cuts it to 9:16, re-paces it, grades the colour, and writes captions (even from the real speech) — in **4 styles**: punchy, cinematic, meme, beatcut.

```
PYTHONPATH="$(pwd)" python3 edit_video.py --input your_clip.mp4 --captions auto
```

3. Song + lyrics -> art-directed lyric video

Give a **song** and a **lyrics.txt**. ASUR times every word to the vocal, writes the creative direction, and builds a real motion-graphics lyric video (Remotion engine). See the separate *ASUR-Lyric-Video-Guide.pdf* for the full 6-stage walkthrough.

THE HONEST FREE-vs-PAID STORY

Free + local today: real scripts, real voice, real motion, real captions, real editing — everything runs on your Mac with no bills. It is genuinely good, but it is **not** the look of paid frontier models (Veo, Kling, Runway).

Paid later (the dial you turn): because of the firewall + adapter design, swapping in a top paid model is a **config change, not a rewrite**. ASUR's brain, honesty and learning stay the same — only the paintbrush gets sharper. That is why the system, not any single model, is the product.

WHO ASUR IS FOR

Buyer	Why they buy ASUR specifically
Agencies & studios	Produce client short-form at volume without uploading client footage to third-party clouds. The honest evaluator is a credibility tool in client meetings.
Creators & musicians	One idea or one song to a finished Reel on their own laptop, with a repeatable house style that improves with every post.
Privacy-sensitive brands	Legal, finance, healthcare, and regulated sectors that cannot send material to external AI services. Local-first is a hard requirement they can finally meet.
Resellers / white-label	A whole content OS to package under their own brand, with no per-seat SaaS cost bleeding their margin.

HOW IT IS DELIVERED

ASUR installs and runs on the client's own machine. The honest, firewalled core is **Python standard-library only** — it has **zero third-party dependencies** and will run SCRIPT, VIRAL CHECK, and orchestration end to end on a clean Python 3.10+ install with nothing to download from a package server. The media engine (rendering, voice, effects) lives behind an **optional extra** you install only when you want to render.

	Detail
Runs on	The client's own computer (macOS today). No server, no cloud account, no API key.
Core dependencies	None. Standard-library-only core; runs offline.
Data residency	100% local. Footage, scripts, and brand never leave the machine.
Quality assurance	221 tests passing + 1 skipped; a continuous-integration pipeline re-runs them on every change.
Upgrade path	Swap the generation engine (free -> paid frontier) by config, with no app rewrite.

HOW ASUR COMPARES

Most tools own one stage of the job and run in their own cloud. ASUR owns the **whole closed loop** and runs on the client's machine. The row that matters most is the last one: nobody else has the honest, firewalled evaluator.

Capability	ASUR	Runway	CapCut	OpusClip
Whole idea-to-video loop	Yes (one system)	No (single stage)	No (editor only)	No (clips only)
Runs fully local / offline	Yes	No (cloud)	Partly	No (cloud)
No login / no API key	Yes	No	No	No
Honest multi-signal scoring	Yes (12, with evidence)	No	No	'Virality %' guess
Maker / judge firewall	Yes (tested)	No	No	No
Learns from real performance	Yes (loop)	No	No	Limited

Competitor names are used only to describe category differences. ASUR's point is not that it out-renders a frontier model today — it is that ASUR is the **honest system around** whichever model you choose, and the only one that keeps the judge firewalled from the maker.

THE BUSINESS CASE

Cost of the status quo. A typical short-form stack is four or five separate cloud subscriptions, paid per seat, every month, forever — plus the hidden cost of handing your footage and brand to someone else's servers. ASUR replaces that recurring, data-leaking stack with one system the client owns and runs locally.

Where the value lands. Fewer subscriptions, no footage leaving the building, a faster idea-to-publish path, and an evaluator the client can defend in a room. The learning loop means the output gets better the longer it is used — value compounds instead of resetting each month.

PACKAGING (ready to price)

Package	What is included	Pricing model
Local Free Core	The honest, firewalled, stdlib-only core: SCRIPT + VIRAL CHECK + orchestration + local rendering. Runs offline, no bills.	Foundation / trial
Studio	The full editing room, the 3 creation tools, house-style learning, and support — set up for a team.	Per-studio licence
Frontier Dial	Adds the optional paid-model generation adapters for top-tier visuals, billed through on real render cost only.	Usage-based add-on
White-label / OEM	ASUR delivered under the partner's own brand for resale, with no per-seat SaaS cost.	Partner agreement

Package names and structure are a proposed commercial framing, not a committed price list — the numbers are set per deal. The technical capability behind each tier is real and shippable today (the Frontier Dial is the documented, config-level upgrade path).

STRAIGHT ANSWERS (buyer FAQ)

Question	Honest answer
Does our footage go to the cloud?	No. Everything runs on your machine. Nothing is uploaded; there is no account and no key.
Is the 'viral score' real?	There is no single viral score. ASUR gives 12 honest signals with evidence and refuses to fake a percentage.
Can the scoring be gamed to pass?	No. A firewall keeps the maker and the judge apart, and tests prove they never talk directly.
Is it as good as Veo / Kling / Runway today?	Not on raw render yet — free local output is genuinely strong but not frontier. The paid dial closes that by config, not rewrite.
Are we locked in?	No. The core needs no subscriptions and no third-party packages. Paid models are optional and swappable.
Is it finished and tested?	All 9 build phases are complete with 221 tests passing (1 skipped) and continuous integration on every change.

The road to 'best in the world' (5 stages)

Stage	Goal	Status
Stage 1	Elite script brain	DONE
Stage 2	Genuinely good free render	IN PROGRESS
Stage 3	Prove the honest moat with real data	NEXT
Stage 4	A clean product people touch	PLANNED
Stage 5	Flip the quality dial with paid models (adapter swap)	PLANNED

Family tree: how the whole thing flows

NEXT STEP

The fastest way to evaluate ASUR is a live, local demo: one idea in, a finished 9:16 short out, with the 12 honest scores shown on screen — all on a machine that never touches the internet. Request a walkthrough, a pilot on your own footage, or white-label terms.

This guide is generated from a script. Whenever ASUR changes, re-run `python3 lyric_video_guide/make_brand_guide.py` to produce an updated copy. It does not update on its own.
